FACELESS48 · LESSON 7

Animated explainers

Turn your voice into an animated video with no camera and nothing to film.

> All you need is a voiceover. The plug-in reads the words you said and places each picture on the exact word. A written script by itself cannot do that, which is why you start from audio.

Words in bold are what you say to your assistant.

1. Record your voiceover

Record in a quiet room at your normal pace and keep one take you like. Put it in your raw folder.

Tell your assistant: **Turn my voiceover into an explainer.**

2. Choose a look

Three styles: **Whiteboard** is clean line art. **Editorial** is led by serif typography. **Dark** is a dark background with light figures.

Before it builds the whole video, it shows you a still of the style so you can say yes or no.

3. Layouts

Your assistant picks the layout that fits your idea: **Compare** puts two things side by side. **Numbered List** walks through steps. **Layers** stacks ideas. **Load versus Capacity** shows how much something is carrying against what it can carry. **Process or Loop** shows a cycle.

Load versus Capacity needs **real numbers from you**. Your assistant will not invent them. Without numbers, it picks another layout.

4. Who is on screen

By default, a stick figure drawn in code, so you need nothing.

If you have your own 2D or 3D character art, you can use that. Give it clear poses, all the same size, on a transparent background. Make sure you own the rights.

5. Portrait or landscape

Portrait is for Reels, TikTok and Shorts. Landscape is for YouTube. You can make the same explainer in both.

6. Your own images and footage

You can also make a video out of your own images and footage with a voiceover. Same command, same process. You bring the pieces and it builds the timing.

7. Change anything with a sentence

Make the figure smaller. Use the dark style. Change the third scene to a list.

Before you move on

- ☐ I recorded one voiceover take.
- ☐ I approved the style still.
- ☐ I tried both portrait and landscape.
- ☐ I changed one thing with a sentence.

Transcript

Welcome to lesson seven. This is the one where you turn your voice into an animated video, with no camera and nothing to film.

All you need is a voiceover. Your own recording. Say this: Turn my voiceover into an explainer.

The recording is what everything is timed to. The plug-in reads the words you said and places each picture on the exact word. A written script by itself can't do that, which is why we start from audio.

Now the look. There are three styles. Whiteboard is clean line art. Editorial is led by serif typography. Dark is a dark background with light figures. Before it builds the whole video, it shows you a still of the style so you can say yes or no.

Next, layouts. These are the ways a scene can be organized, and your assistant picks the one that fits your idea. Compare puts two things side by side. Numbered List walks through steps. Layers stacks ideas. Load versus Capacity shows how much something is carrying against what it can carry. Process or Loop shows a cycle.

A heads-up on that one. Load versus Capacity needs real numbers from you. The assistant won't invent them. If you don't give it numbers, it picks another layout.

Who is on screen? By default, a stick figure drawn in code, so you need nothing. If you have your own character art, a 2D or 3D character you own, you can use that instead. Give it clear poses, all the same size, on a transparent background, and it builds around them. If you use a character, make sure you own the rights.

You can use portrait for Reels, TikTok and Shorts, or landscape for YouTube. Here's the same explainer in both.

You can also make a video out of your own images and footage with a voiceover. Same command, same process. You bring the pieces, it builds the timing.

And just like your talking heads, you can change anything with a sentence. Make the figure smaller. Use the dark style. Change the third scene to a list.

So that's lesson seven. Your voice, a few sentences to your assistant, and you have an animated video. Every explainer is a little lesson, and the examples you've been watching are the lesson. Make one this week. I'll see you in the next one.
