FACELESS48 · LESSON 5

Styles, effects and music

Choose a look, let your assistant place the effects, and add your own licensed music.

> Your videos never start from a blank page. A style is a saved bundle of choices, and you can mix and change them in a sentence.

Words in bold are what you say to your assistant.

1. Pick a style

Tell your assistant: **Make this one Spotlight.** That is the whole command.

Signature	Your everyday look. Kinetic editorial captions and the metal trim from your brand.
Quiet Authority	Calm and premium. Pill-style captions, a plain black background and soft music.
Spotlight	Dramatic. Heavy captions, velvet, a copper outline and big moments.
Show and Tell	For teaching. Your points appear as you say them, with stacks, checklists and callouts.
Hype Reel	Fast and loud. Orbit and wall effects and full sound.
Raw Tape	Unpolished and real. Pill captions, grain and no music.

A seventh style, Yap, is for casual videos. It has its own lesson.

2. Mix styles

Say: **Make this one Spotlight, but keep my Signature captions.**

Behind every style are separate dials: the captions, the background, the finish, the color look, the music level, the sound, the outline and the effects. A style sets all of them at once, and you can change one dial without losing the rest.

3. Let your assistant place the effects

There are more than 100 in the library: animated text and cards, zooms and camera moves, spotlights, orbiting elements, clones, phone screens and checklist graphics,

charts, transitions and end cards. You do not pick them from a menu. Your assistant reads your script, finds the moments that deserve one and places each effect on the exact word.

Its rules: one strong effect every four to six seconds is plenty; no effect ever sits on your face; and it only uses effects that add something instead of repeating the caption.

4. Cutouts for behind-you effects

Some effects put you in front of the graphic, like a wall of type behind you. Those need a cutout of you.

The default cutout is quick. If the edge does not look clean, your assistant can switch to a higher-quality cutout. That one needs a one-time download and takes longer, so it only runs for the seconds an effect needs. Your assistant asks before it downloads anything big.

If an effect does not look right the first time, that is normal. Preview it, tell your assistant what to change, and it adjusts.

5. Add your own music

Put your track in the music folder and say: **Add my music.** Your assistant lowers the music under your voice, fades it in and out, and matches the length of your video.

Use only music you own or have the license for. The plug-in does not supply tracks to redistribute.

Your assistant cannot hear, so you approve the final mix by ear.

Before you move on

- ☐ I chose a style by saying it in chat.
- ☐ I tried mixing one style with another style's captions.
- ☐ I previewed the effects and asked for one change.
- ☐ I added my own licensed music and listened to the mix.

Transcript

Welcome to lesson five, and this one is the fun one, because we're talking about how your videos actually look and sound. Styles, effects, and music. And the best part is you never have to start from a blank page.

Let's start with step one, styles. A style is a saved bundle of choices. Think of it like picking an outfit instead of building one piece at a time. Here's one clip in six different styles. Watch how much the feel changes.

Signature is my everyday look. Kinetic editorial captions and the metal trim from your brand. Quiet Authority is calm and premium. Pill-style captions, a plain black background, and soft music. Spotlight is dramatic. Heavy captions, velvet, a copper outline, and big moments. Show and Tell is for teaching. Your points show up right as you say them, with stacks, checklists, and callouts. Hype Reel is fast and loud, with orbit and wall effects and full sound. And Raw Tape is unpolished and real. Pill captions, grain, and no music.

Yes, there's a seventh one called Yap, for your casual videos. It gets its own tutorial, so hang tight.

So how do you pick one? You just say it in chat. "Make this one Spotlight." Done. Truly.

Now, what if you love Spotlight, but you want your Signature captions? You can mix. Say, "Make this one Spotlight, but keep my Signature captions." That works because behind every style there are separate dials. The captions, the background, the finish, the color look, the music level, the sound, the outline, and the effects. A style just sets all of them at once, and you can change one dial without losing the rest.

All right, step two, effects. There are more than 100 in the library. Animated text and cards, zooms and camera moves, spotlights, orbiting elements, clones, phone screens and checklist graphics, charts, transitions, end cards. And here's the good news. You don't pick them from a menu. Your assistant reads your script, finds the moments that deserve one, and puts each effect on the exact word.

It plays by a few rules, and I like them. One strong effect every four to six seconds is plenty. No effect ever sits on your face, and it only uses effects that add something, not ones that just repeat what the caption already says.

Now, some effects put you in front of the graphic, like a wall of type behind you. Those need a cutout of you. The default cutout is quick. If the edge doesn't look clean, your assistant can switch to a higher-quality cutout. That one needs a one-time download and takes longer, so it only does it for the seconds an effect needs. And it asks you before it downloads anything big. And if an effect doesn't look right the first time, that's normal. You preview it, tell your assistant what to change, and it adjusts.

Okay, last step, music. You can use your own licensed music. Put your track in the music folder and say, "Add my music." It lowers the music under your voice, fades it in and out, and matches the length of your video. One important thing: use only music you own or have the license for. I can't

hand you a track to redistribute, and I'd never tell you it's fine to use something you just found online. Also, your assistant can't hear, so the final mix is yours to approve by ear.

So that's the whole run. Pick a style, mix it if you want to, let your assistant place the effects, and add your own music. I'll see you in the next one.
