FACELESS48 · LESSON 6

Edit my yap

One command turns a casual, real video into a light, finished edit.

> A yap is a casual talking video: in the car, on the couch, at your desk. It is supposed to feel real, so the edit is light on purpose.

Words in bold are what you say to your assistant.

1. Run the command

Tell your assistant: **Edit my yap.**

It adds word-by-word captions with a few key words in color, trims the long pauses, adds a quiet music bed and puts in two or three slow zooms. It leaves the room showing so the video still feels real.

2. Adjust the pauses

The plug-in tightens every silence longer than a set length. The default is three tenths of a second.

Want it looser? Ask for **four tenths**. Want it snappier? Ask for **two tenths**.

These are jump cuts, so your assistant checks your pose at each one.

3. Confirm the transcript

Before it edits anything, your assistant shows you the transcript and asks you to confirm the words. Read it. Check your name and any links.

4. Joining pieces

If you recorded your yap in a few pieces, say: **Join these clips into one yap.** It lines them up first, then edits the joined video.

5. What a yap does not get

No end card. It ends right after your last line, before your hand reaches for the camera.

No stack of effects. A yap should look like a yap, not like a polished talking head.

6. Keep your original audio

Voice-changing tools can strip out the room sound, and the room sound is what makes a yap feel real.

7. If something looks off

If your assistant says *that's a talking head, not a yap*, it asks you one time which one you meant. Pick one and it keeps going.

Captions can look a hair late against a mouth, especially on an AI avatar. If you spot one that is off, tell your assistant the exact second and the word. That is how it gets fixed.

Before you move on

- ☐ I confirmed the transcript before it edited.
- ☐ I tried a looser or snappier pause setting.
- ☐ I kept my original audio.
- ☐ I checked the captions against my mouth and reported any that were off.

Transcript

Welcome back to lesson six. This one is my favorite: the yap.

If you're not sure what a yap is, it's a casual talking video. In the car, on the couch, at your desk. It's supposed to feel real, which is exactly why the edit is light on purpose.

Let's start with the before. Here's the raw clip, and here's the same clip after one command. The command is: "Edit my yap." So what happened? First, it added word-by-word captions, with a few key words in color. Second, it trimmed the long pauses. Third, it added a quiet music bed. Fourth, it put in two or three slow zooms, and it left the room showing, so you still feel like you're sitting in the car with me.

Now let's talk about those pauses, because this is the part you can adjust. The plug-in tightens every silence longer than a set length. The default is three tenths of a second. Want it looser? Ask for four tenths. Want it snappier? Ask for two tenths. Since these are jump cuts, your assistant checks your pose at each one so it doesn't look jumpy.

Next, before it edits anything, it shows you the transcript and asks you to confirm the words. Please actually read it. Check your name and any links.

And if you recorded your yap in a few pieces, no problem. Say, "Join these clips into one yap." It lines them up first, then edits the joined video.

Now here's what a yap does not get. No end card, and it ends right after your last line, before your hand reaches for the camera. No stack of effects either. A yap should look like a yap, not like a polished talking head.

One tip I really mean: keep your original audio. Voice-changing tools can strip out the room sound, and the room sound is what makes a yap feel real.

Also, if your assistant ever says, "That's a talking head, not a yap," it's going to ask you one time which one you meant. Just pick one, and it keeps going.

And one more note on captions. They can look a hair late against a mouth, especially on an AI avatar. If you spot one that's off, tell your assistant the exact second and the word. That's how it gets fixed.

So that's a yap. One command, a light edit, and it still feels like you. I'll see you in the next one.
