FACELESS48 · LESSON 8

Life Scenes

A few seconds of your life, animated, with a few words that stay with people.

> A Life Scene is a still image that moves just enough to show a moment, with a few words of text on it. Your character does one small, ordinary thing: reading a book and flipping the page, taking a sip of coffee, getting into the car, typing at a laptop in the morning light, watering a plant, writing in a planner, staring out a window while it rains. Nobody is talking. The words carry the message.

Words in bold are what you say to your assistant.

1. Gather your clips

Clips can come from Google Flow, Veo, Seedance or Kling, stock footage or your own camera. Your character can be your AI avatar or a 2D animation.

If a clip has its own music or speech baked in, listen to it first.

2. Run the command

Say: **Make a Life Scene.** Then tell it: a title, the clip or clips, the message of the scene, and whether you have a voiceover.

3. Approve the words first

Your assistant writes the on-screen words first, and you approve them before anything is built. Lines stay short, about 22 characters each, two or three lines on a card, written the way you talk. Stiff wording from a prompt gets rewritten in plain English.

4. Pick a camera move

Each clip gets one move. **Slow zoom** pushes in. **Pullback** starts on a small detail and reveals the whole scene. **Punch** is a quick zoom on a beat. **Drift** is a gentle handheld sway. **Freeze** holds the frame while your text lands.

5. Add an overlay

A text message that types out, sends and gets a reply. A paper note that writes itself line by line. A stack of notification cards. A tilted phone with a list of recordings. A checklist that ticks off one item at a time. Comments that pop in with a heart. A timeline that lights up one point at a time.

Every word inside an overlay comes from you. Names and handles stay generic, never a real person's.

6. Check the frames

Life Scenes are vertical, 1080 by 1920. Before it renders, your assistant pulls a frame at every text moment so you can check that nothing is cut off and nothing sits on a face. You approve, and it renders.

Before you move on

- ☐ I listened to each clip first.
- ☐ I approved the on-screen words before the build.
- ☐ I chose one camera move per clip.
- ☐ I checked the frames before rendering.

Transcript

Welcome to lesson eight, where we get into the cinematic. This one is called a Life Scene.

A Life Scene is a few seconds of your life, animated. Picture a still image that moves just enough to show a moment, with a few words of text on it. You see these all over social media. It takes you from a full cinematic clip down to one tiny moment that says something.

Your character is doing one small, ordinary thing. Reading a book and flipping the page, taking a sip of coffee, getting into the car, typing at a laptop while the morning light comes in, watering a plant, writing in a planner, staring out a window while it rains. Your character can be your AI avatar or a 2D animation. Nobody is talking. The words on the screen carry the message, and they turn a pretty little moment into something people remember.

Step one, the clips. Where do they come from? Google Flow, Veo, Seedance, or Kling. Stock footage or your own camera. One thing to watch for: if a clip has its own music or speech baked in, listen to it first, so there are no surprises later.

Step two, the command. Say, "Make a Life Scene." Then tell it a few things. A title, the clip or clips, the message of the scene, and whether you have a voiceover.

Step three is the part I like most. Your assistant writes the on-screen words first, and you approve them before anything gets built. The lines stay short, about 22 characters each, two or three lines on a card. They're written the way you talk, so they land on a single hearing. And if you hand it stiff wording straight out of a prompt, it rewrites it in plain English.

Step four, the camera. Each clip gets one move. A slow zoom pushes in. A pullback starts on a small detail and then reveals the whole scene. A punch is a quick zoom right on a beat. A drift is a gentle handheld sway, and a freeze holds the frame while your text lands.

Now the overlays, and this is where it gets fun. A text message that types out, sends, and gets a reply. A paper note that writes itself line by line. A stack of notification cards. A tilted phone with a list of recordings. A checklist that ticks off one item at a time. Comments that pop in with a heart, and a timeline that lights up one point at a time.

Every word inside those overlays comes from you. The names and handles stay generic, never a real person's. That's on purpose.

Last step, the check. Life Scenes are vertical, 1080 by 1920. Before it renders, your assistant pulls a frame at every text moment so you can make sure nothing is cut off and nothing sits on a face. You approve, and then it renders.

Use a Life Scene between your talking points, or let it stand on its own. One clip, one message, one feeling. I'll see you in the next one.
