FACELESS48 · RECORDING SCRIPTS

Lessons 1, 2, 3, 4 and 9

Read the plain text aloud. Gray lines in parentheses are screen cues, so don't read them.

Contents

LESSON 1: DOWNLOAD, INSTALL AND OPEN IT

LESSON 2: GET ME SET UP

LESSON 3: ADD YOUR FOOTAGE AND VOICEOVER

LESSON 4: MAKE MY VIDEO

LESSON 9: STOCK FOOTAGE

Download, install and open it

Welcome to lesson one. By the end of this lesson, the plug-in is on your computer, open, and ready to set up.

One quick thing before we start. This beta is for a computer with Claude Code or Codex and access to your local files. That means the desktop app or the terminal on your own computer, not the chat in your browser.

Step one, download. Your files are attached to the first lesson in your course. There are two: the plug-in zip, and the Start Here guide. Download both. *(Show the lesson and the two files.)*

Step two, unzip it. Put the plug-in in a folder that is not synced to the cloud. That means not iCloud, not OneDrive, and not Dropbox. Cloud sync can stall the install, so pick a regular folder on your computer. *(Show the unzip and the folder.)*

Step three, open that folder in your assistant, Claude Code or Codex, on your own computer. Open the folder itself. *(Show the folder opening.)*

Step four, paste the first message. It's in the Start Here guide, and it's also in the course lesson. *(Show the message on screen.)* It tells your assistant to read the plug-in's instructions, create a new project folder, check your

computer's requirements, and then walk you through your brand setup. It also says to explain any missing software in plain language, and never to overwrite existing files. Paste it and press enter. *(Show it running.)*

Step five, the requirements check. The plug-in needs Node 20 or newer, ffmpeg, and a browser. If something is missing, your assistant tells you in plain language what it is and what to do. My computer already has everything, so this passes right away. *(Show the check passing.)*

It works the same way in Claude Code and in Codex. Open the folder, paste the same message, and your assistant takes it from there.

Last, what happens next. Your first setup takes 30 to 60 minutes, and you only do it once. That's lesson two.

And if you ever get stuck, email support@c3global.co with what you asked and the exact error. Never include passwords or API keys.

I'll see you in lesson two.

Get me set up

Welcome to lesson two. This is the lesson where you teach the plug-in who you are. You do it one time. After that, every video you make already looks like you.

Plan on 30 to 60 minutes for your real setup. I'm going to move a little faster here so you can see the whole shape of it.

Step one, the command. You start with one sentence. Type: "Get me set up." *(Type it on screen.)* That's the whole command.

Step two, your business. Your assistant asks about your business first. Your brand name, exactly the way you want it on screen. A tagline, if you have one. And in a sentence or two, who your videos are for and what you help them with. It writes that down so it never has to ask again.

Step three, your logo. The best file is a PNG with a transparent background. If your logo has a white box around it, your assistant will tell you, and you can keep it or swap in a better file. Copy the logo into your project's brand folder and tell your assistant the file name. *(Show the copy.)*

Step four, your colors. You need three. A main color, a darker version, and your darkest one for backgrounds. They're

written as hex codes: a pound sign and six characters. If you don't know yours, there are three easy places to look. In Canva, click a colored shape in a branded design and the code shows up next to the color. On your website, right-click a colored button, choose Inspect, and the code is in there. Or give your assistant your logo and it will suggest colors from the file. It tells you those are only suggestions, and nothing gets saved until you say yes.

Step five, your metallic finish. Your videos have a thin metal trim on the frames, lines, and check marks. You choose gold, rose gold, silver, or copper. Your assistant shows you the choices, so you aren't guessing from a word.

Step six, fonts. You pick a pairing from the ones that come with the plug-in. If you have a brand font that isn't on the list, tell it. A custom font has to be added and tested, so it can't be promised on the spot.

Step seven, who is on screen. Your face. An AI avatar of you made in another tool. A cartoon or 3D character you own. The built-in stick figure. Or no one at all, just voiceover and graphics. You can pick more than one. If you bring your own character art, make sure you own the rights to it.

Step eight is my favorite part: your caption style. Your assistant makes one image that shows three caption styles

side by side, in your colors. Editorial is elegant, with words arriving in polished lockups. Heavy is big and bold, built for social. Pill is classic subtitles in a rounded pill. *(Zoom in on the image.)* Look at it, pick the one that feels like you, and say so. You can still ask for a different style on any single video later.

Step nine, your defaults. Portrait for Reels, TikTok, and Shorts, landscape for YouTube, or both. Your talking-head style. Your explainer style. And whether you want background music.

Then it saves everything into two files: your brand file and a plain-English profile. It reads the summary back to you and asks if you want to change anything. This is the moment to say yes if something felt off.

And you're done. If you ever want to change your brand, say "Change my brand," and it shows you what's saved and asks what to update. It never makes you start over.

Your next step is lesson three, where we get your footage and your voiceover to your assistant. I'll see you there.

Add your footage and voiceover

Welcome to lesson three. Your assistant can't edit what it can't reach. So in this lesson, I'll show you the two ways to get your video and your voiceover to it.

First, how big a clip should you start with? Thirty to sixty seconds is ideal. Keep your early tests under about two minutes. You can go longer once you trust the process.

Step one is method one. It's the easiest, and it's the one I use. If your assistant runs on your own computer, which means Claude Code or Codex on your machine, you don't upload anything. Open your project folder. Inside it there's a folder for raw media. *(Show the folder.)* Drag your video into that folder. Then tell your assistant the file name. That's it. Nothing leaves your computer.

Step two is method two, for when your assistant runs in the cloud. That means Claude Code on the web, a Codex cloud task, or something you started from your phone. A cloud assistant can't see your computer's files, and chat attachments have size limits that most talking-head videos blow right past.

So put the video in a cloud folder. Upload it to Google Drive, Dropbox, or OneDrive. Then set sharing so anyone with the

link can view it. In Drive, click Share, change the access to Anyone with the link, and copy the link. *(Show each click.)* Paste the link into the chat and say: "Download this video into my project and edit it."

Two things to know. First, when the edit is done, go back and set sharing back to Restricted. Don't leave your video open to anyone who has the link. Second, a cloud assistant sometimes can't reach the file host. If the download is blocked, your assistant tells you which web addresses to allow in your environment settings, and the Start Here file lists them.

Step three, your voiceover. For an explainer, your voiceover is the timing for the whole video. The recording matters more than a written script, because the plug-in lines up the pictures with the words you actually said. A script alone can't tell it when each word happens.

So record in a quiet room, speak at your normal pace, and keep one take you're happy with. Save it as an audio file and put it in the raw media folder the same way, or share it by link. Then tell your assistant what it is: "This is my voiceover. Turn it into an explainer." You'll see that in lesson seven.

One last tip. Don't paste passwords or private keys into the chat, ever. We'll come back to that in the stock footage

lesson.

Quick recap. Small or local: drop it in the raw folder. Cloud assistant: share by link, then set it back to Restricted. And start short. I'll see you in lesson four, where we make your first edit.

Make my video

Welcome to lesson four. This is the lesson you've been waiting for. Your clip goes in, and a finished video comes out.

Your clip is already in the raw folder. So step one is three words. Type: "Make my video." *(Type it on screen.)*

Step two, the transcript. Before it builds anything, your assistant listens to your clip and writes out everything you said. It shows you and asks you to check it. Please don't skip this. Look for your name, any brand names, links, and your last line. Voice-to-text sometimes spells a name two different ways, and sometimes it invents a word after the audio ends. If something is wrong, tell it, and it fixes it.

It also checks the ending of your take. If your clip is cut off in the middle of a sentence, it tells you before it edits anything, so you don't find out at the end.

Step three, the plan. Now it plans the video using your saved style and your saved brand. It follows a set of editing rules I built from weeks of real edits. A change on screen at least every four seconds. You stay full frame for about four seconds at a time, six at most. Nothing sits on your face. Text stays clear of the places where the app buttons live. And effects land on the exact word you say, not a guess.

Step four is the part I love: the storyboard. Before it renders anything, it makes your whole video as numbered pictures, in order, with the words being said under each one. *(Zoom in on the storyboard.)* You look at it, and you either say "Approve," or you name the numbers you want changed. "Frame six is too busy, make it simpler." "Frame nine covers my face." It changes only those parts and makes a new storyboard. Nothing renders until you say yes.

There's also a built-in checker. It looks for captions that cover a graphic, captions that repeat what's already on screen, and effects that land on the wrong word. It fixes what it finds, or tells you why something stays.

Step five, the render. You approve, and it renders. A video usually takes 30 minutes to an hour, and longer videos take longer. You don't have to sit and watch. Film your next one, answer email, take a walk.

Step six, the check. When it's done, it checks the file: the length, the size, and whether there's sound. Then it hands you the video. It also tells you what it could not check. It can look at pictures, but it can't hear. So you listen to the music and the voice yourself.

If you want a change, ask for it in plain words. "Make the captions bigger." "Move them to the top." "Try the Spotlight

style." It never overwrites your old video. It makes a new version and keeps the first one.

And if you have several clips, you can ask for a batch. It makes them one after another, and if one fails, it tells you which and keeps going with the rest.

One more thing. It never posts for you and never schedules anything. The finished video is yours to post.

You just made your first video. Next up, lesson five, where we make it look even more like you. I'll see you there.

Stock footage

Welcome to lesson nine. Stock footage is optional. Everything works without it. But if you want B-roll to cut away to, I'll show you how to add free clips from Pexels and Pixabay, with your own keys.

First, what's a key? A key is like a library card. It lets the plug-in search on your behalf. They're free, and they take about five minutes each. Your keys stay on your computer. I never see them, and they're never part of the plug-in.

Step one, Pexels. Go to pexels.com/api and sign in. Click Your API Key, and fill in the short form. The app name can be anything, like "My video projects." Copy the key. *(Blur or cut the key.)*

Step two, Pixabay. Go to pixabay.com/api/docs and sign in. Scroll down to Parameters. Your key is shown right there next to the word key. Copy it. *(Blur or cut the key.)*

Step three, where the keys go. In your project folder there's a file called stock-keys example. Make a copy of it and name the copy stock-keys.json. Open it, paste each key between the quotes, and save. *(Blur or cut the keys.)* Then say to your assistant: "Check my stock keys." It tells you "set" for each one it found. It never prints your keys back to you.

One rule I'll repeat. Never paste your keys into the chat, an email, or a shared document. If you think a key got out, make a new one on the website. You can use just one provider. You don't need both.

If your assistant runs in the cloud, you set the keys as environment secrets instead of a file, and you allow a few web addresses. The stock footage guide lists them.

Step four, use it. Say: "Find stock footage for this video." First, it reads your script and writes a shot list. Each shot becomes a search phrase of two to four concrete words. What's in the frame, not the idea. "Woman typing laptop night," not "productivity."

Step five, choose. It searches and shows you results. Each one shows where it's from, how long it is, who made it, and a link to the clip's page. It also saves preview images. Look at them, open the page links to watch the clips, and you choose.

Step six, download. Only then does it download. One clip per choice, and nothing else. It saves each clip into your project and records the source and the creator in a credits file.

Step seven, use it as a cutaway. Once your clips are downloaded, you don't have to place them yourself. Tell your assistant where you want one. Something like: "When I say

blank screen, cut away to the laptop clip." *(Say it on screen.)* The clip fades in over you and fills the whole frame. It slowly moves, either a gentle push in, a pull back, or a quick zoom on a beat. Then it fades back to you. Your voice never stops. It keeps playing the whole time, and the clip's own sound is turned off, so nothing fights with you. Two to four seconds is the sweet spot. Long enough to see it, short enough that you don't lose the person. It works in vertical and horizontal videos, and it works with your own clips too, not just stock. *(Show the storyboard frame with the cutaway.)* And just like everything else, you see it in the storyboard first. If it's too long, or it covers the wrong word, say so, and it changes only that frame.

Step eight, credits. When your video is done, say: "Show me my stock credits." It gives you a credit line for each clip, ready to paste into your caption or description.

A few rules the tool follows. Pixabay requires results to be saved for 24 hours, so the same search within a day doesn't hit their service again. Clips are downloaded before use, never streamed from the website. And it will never bulk-download or build you a library of clips you aren't using.

Both sites' licenses allow free use in videos, with limits. For anything sensitive, like an ad with a recognizable person or

brand, read the license page yourself. The terms can change, so check them before you publish commercially.

If you hit "too many requests," wait a little and try again. Both sites limit searches. And if a portrait search seems to hide some results, the tool tells you, and you can ask to see everything.

That's stock footage. Optional, free, and you stay in charge of every clip. And that's the last lesson, so you have everything you need. Go make something wonderful.
