FACELESS48 · LESSON 1

Download, install and open it

Get the plug-in onto your computer, open, and ready to set up.

> This beta is for a computer with Claude Code or Codex and access to your local files. That means the desktop app or the terminal on your own computer, not the chat in your browser.

Words in bold are what you say to your assistant.

1. Download

Your files are attached to the first lesson in your course. There are two: the plug-in zip and the Start Here guide. Download both.

2. Unzip it

Put the plug-in in a regular folder on your computer that is **not** synced to the cloud: not iCloud, not OneDrive and not Dropbox. Cloud sync can stall the install.

3. Open the folder in your assistant

Open that folder in Claude Code or Codex, on your own computer. Open the folder itself.

4. Paste the first message

It is in the Start Here guide and in the course lesson. Paste it and press enter:

Read skills/video-production/SKILL.md and skills/brand-setup/SKILL.md. Get me set up: create a new project folder, check my computer's requirements, then walk me through my brand setup. Explain any missing software in plain language. Do not overwrite existing files.

It tells your assistant to read the plug-in's instructions, create a new project folder, check your computer's requirements and walk you through your brand setup. It never overwrites existing files.

5. The requirements check

The plug-in needs Node 20 or newer, ffmpeg and a browser. If something is missing, your assistant tells you in plain language what it is and what to do. If everything is already installed, the check passes right away.

Claude Code or Codex

It works the same way in both. Open the folder, paste the same message, and your assistant takes it from there.

What happens next

Your first setup takes 30 to 60 minutes, and you only do it once. That is lesson 2.

If you get stuck

Email support@c3global.co with what you asked and the exact error. Never include passwords or API keys.

Before you move on

- ☐ I downloaded the plug-in zip and the Start Here guide.
- ☐ I unzipped the plug-in into a folder that is not cloud-synced.
- ☐ I opened that folder in Claude Code or Codex on my own computer.
- ☐ I pasted the first message and the requirements check ran.

Transcript

Welcome to Lesson 1. By the end of this lesson, the plugin will be on your computer, open, and ready to set up. One quick thing before we start. This beta is for a computer with Claude Code or Codex, better known as ChatGPT, and access to your local files.

That means the desktop app or the terminal on your own computer, not the chat in your browser. Step 1. Download. Your files are attached to the first lesson in your course.

Go to "Start Here" and you will see "Download the plugin" and set it up. Now, there are two downloads. The plugin, which is beta 0.7 at the time of recording, and the "Start Here" guides. You want to download both.

Download and download. Step 2. Unzip it. Put the plugin in a folder that is not synced to the cloud.

Open Finder, go into the folder you have, and open it. For me, I created a folder here. Find the download and drag it in there. Both downloads will work.

Start here, and there we go. The folder is not in iCloud, OneDrive, or Dropbox. It is in a folder on your local drive. OK.

Step 3. Open that folder in your local assistant. This could be Claude Code or Codex. I have tested it on both, and it works exactly the same.

First, start a new chat. I am already in a new session. Choose your environment. I am going to choose the environment I already have set, which is ContentOS.

Now, I am going to add my folder. I need a local session. Hold on. This computer.

There we go. All right. I will choose my folder. I think I was right.

Yes. OK. Open folder. There we go.

Open. I just opened the whole folder, and I am going to trust the workspace. Step 4. Paste the first message.

It is in the Start Here guide you downloaded, and it is also in the course. For the sake of time, I will copy it from the course and paste it directly into the chat. This tells your assistant to read the plugin's instructions, create a new project folder, check your computer's requirements, and then walk you through your brand setup. It also says to explain any missing software in plain language and never to overwrite existing files.

Simply paste it and press Enter, and you will see that it is in process. Step 5 is the requirements check. It is currently doing that right now. The plugin needs Node 20 or newer, FFmpeg, and a browser.

If something is missing, your assistant tells you in plain language what it is and what to do. My computer already has everything, so this passes right away. Then it asks me, "Where should I unpack the Faceless48 package and create your project folder?" I will use the recommended folder since that is the one I created.

Again, it works the same way in Claude Code and in Codex. As it is getting the folder together, open the folder. You can see it is already doing it. If you are doing this in Codex, which is GPT, you would do it the exact same way.

Just open the folder, paste the same message you see in the Start Here guide, and in Lesson 1, and your assistant takes it from there. Lastly, what happens next? Your first setup takes about 30 to 60 minutes, and you only do it once. That comes in Lesson 2.

If you ever get stuck, email support@c3global.co with what you asked and the exact error. Never include your passwords or API keys. That is all for Lesson 1. I will see you in lesson 2.
