FACELESS48 · LESSON 3

Add your footage and voiceover

Two ways to get your video and your voiceover to your assistant.

> Your assistant cannot edit what it cannot reach. Start with a clip of 30 to 60 seconds, and keep early tests under about two minutes.

Words in bold are what you say to your assistant.

Method one: your assistant runs on your computer

This is the easiest. It means Claude Code or Codex on your own machine. You upload nothing.

Open your project folder. Inside it is a folder for raw media (**public/raw**). Drag your video into it and tell your assistant the file name. Nothing leaves your computer.

Method two: your assistant runs in the cloud

That means Claude Code on the web, a Codex cloud task, or a session started from your phone. A cloud assistant cannot see your computer's files, and chat attachments have size limits most talking-head videos blow past.

1. Upload the video to Google Drive, Dropbox or OneDrive.

2. Set sharing to **Anyone with the link can view**. In Drive, click Share, change the access, and copy the link.

3. Paste the link into the chat and say: **Download this video into my project and edit it.**

4. When the edit is done, set sharing back to **Restricted**.

If the download is blocked, your assistant tells you which web addresses to allow in your environment settings. The Start Here guide lists them.

Your voiceover

For an explainer, your voiceover is the timing for the whole video. The recording matters more than a written script, because the plug-in lines up the pictures with the words you actually said. A script alone cannot tell it when each word happens.

Record in a quiet room at your normal pace and keep one take you are happy with. Save it as an audio file, put it in the raw folder the same way (or share it by link), and say: **This is my voiceover. Turn it into an explainer.** You will do this in lesson 7.

Never share these in chat

Passwords or private keys, ever.

Quick recap

Small or local: drop it in the raw folder. Cloud assistant: share by link, then set it back to Restricted. And start short.

Before you move on

- ☐ I put a short clip in the raw folder and told my assistant its file name.
- ☐ I know how to share a file by link and set it back to Restricted.
- ☐ I recorded one voiceover take I like.
- ☐ I know not to paste passwords or keys into chat.

Transcript

Welcome to lesson three. Your assistant can't edit what it can't reach. In this lesson, I'll show you two ways to get your video and voiceover to it. First, how big a clip should you start with?

30 to 60 seconds is ideal. Keep your early tests under two minutes. That way, you can get everything set up and you can go longer once you trust the process. Step one is method one.

It's the easiest and it's the one I recommend. If your assistant runs on your own computer, meaning Claude Code and Codex are on your machine, then you don't have to upload anything. Just open your project folder, put your raw media inside and drag your video into the chat like I just did. Drag your video into that folder, tell your assistant the file name and that's it.

Nothing leaves your computer, right? Then there's method two for when your assistant runs in the cloud. That means Claude Code is on the web or you're using Codex Cloud task or something you started from your phone. A cloud assistant can't see your computer's files and chat attachments have size limits that most talking head videos blow right past.

So put the video in a cloud folder like Google Drive, Dropbox or OneDrive and set sharing so anyone with the link can view it. In Drive, click share. Change the access from restricted to anyone with the link. Copy the link, click done and then bring your file or your entire cloud folder over to your assistant.

Once you do that, paste the link into the chat. You can say download this video into my project and edit it. Now two things to know. First, when the edit is done, go back and set the sharing back to restricted.

Go back to Google and set it back to restricted. Don't leave your video open to anyone who has the link. Second, a cloud assistant sometimes can't reach the file host. If the download is blocked, your assistant tells you which web addresses to allow in your environment settings.

Now, if you're running on cloud, you'll see the environment settings at the top in your drop-down menu. If you're running locally like I am, you won't see that option. As I said, I'm going to drop this video from my folder into the chat and it's already ready to make my first video. The file is uploaded and this is a yap.

I've also included my music folder for you to choose the most appropriate background song for this holiday yap. Now you don't have to type all of that. I just wanted to give it a little extra direction ahead of time instead of coming back later, but it's perfectly fine to just say make my first video, send in the clip, the details, everything, and it will get started. It will get to work.

Next, upload your voiceover. For an explainer, your voiceover is the timing for the whole video. The recording matters more than a written script because the plugin lines up the pictures with the words you actually say. A script alone can't tell it when each word happens, so make sure you record in a quiet room, speak at your normal pace, and keep one take that you're happy with.

Save it as an audio file and put it in the raw media folder the same way or share it by link. Then tell your assistant what it is. This is my voiceover. Turn it into an explainer.

You'll see that coming up in lesson seven. One last tip, never paste passwords or private keys into the chat. We'll come back to that in the stock footage lesson. I just want to give you a quick recap while the video is processing.

Small or local, drop it in a raw folder, cloud assistant, share by link, then set it back to restricted, and start short. I'll see you in lesson four, where we make your first edit. And if you want to see how this video turns out, you can see the video below.

Stuck? Email support@c3global.co with what you asked and the exact error. Never include passwords or API keys.
