FACELESS48 · LESSON 4

Make my video

Your clip goes in and a finished video comes out.

> Your clip is already in the raw folder. Nothing renders until you approve the storyboard.

Words in bold are what you say to your assistant.

1. The command

Type: **Make my video.**

2. Check the transcript

Before it builds anything, your assistant writes out everything you said and asks you to check it. Please do not skip this. Look for your name, brand names, links and your last line. Voice-to-text sometimes spells a name two ways, or invents a word after the audio ends.

It also checks the ending of your take. If your clip is cut off mid-sentence, it tells you before it edits anything.

3. The plan

It plans the video with your saved style and brand, following editing rules built from real edits: a change on screen at least every four seconds, you stay full frame for about four seconds at a time (six at most), nothing sits on your face, text stays clear of the app buttons, and effects land on the exact word you say.

4. The storyboard

Before anything renders, it shows your whole video as numbered pictures, in order, with the words under each one.

Say **Approve**, or name the numbers to change: **Frame six is too busy, make it simpler.** It changes only those parts and makes a new storyboard. You can also say **Show me the storyboard** any time.

5. The checker

A built-in checker looks for captions covering a graphic, captions that repeat what is already on screen, and effects on the wrong word. It fixes what it finds or tells you why something stays.

6. The render

After you approve, it renders. A video usually takes 30 minutes to an hour, and longer videos take longer. You do not have to watch.

7. The check

When it finishes, it checks the length, the size and whether there is sound, then hands you the video and tells you what it could not check. It can look at pictures but it cannot hear, so you listen to the music and the voice yourself.

Changes and batches

Ask in plain words: **Make the captions bigger. Move them to the top. Try the Spotlight style.** It never overwrites your old video. It makes a new version.

With several clips, ask for a batch. It makes them one after another, and if one fails it tells you which and keeps going.

It never posts for you

It never posts or schedules anything. The finished video is yours to post.

Before you move on

- ☐ I checked the transcript and fixed anything wrong.
- ☐ I looked at the storyboard and approved it or asked for a change.
- ☐ I listened to the finished video myself.
- ☐ I asked for one change and got a new version.

Transcript

Welcome to lesson four. This is the lesson you've been waiting for. Your clip goes in, and a finished video comes out. Your clip is already in the raw folder, and we covered a little bit of this in lesson three.

So we're going to jump straight into the results. The assistant will chat with you a little and ask, "Is it okay to download specific assets?" If you've given it the link to songs, like I did in lesson three, then you can say yes. For me, this is probably the best song for the video clip we chose for the demo.

"Lo-fi Christmas" by Wes Harris. And yes, it is okay. The clip is ready to edit. It's a 27 second portrait video, so it tells me everything it's doing.

Then it tells me the transcript it got from the audio. And you want to make sure the transcript is exactly what your script says. It asks for a bit of clarification. The Notion doc says "Dr.

CiCi", but the tool heard "Dr. Cece". So we're going to confirm the spelling and the ending, okay? And the music.

Everything looks great. Use "Dr. CiCi". It gives you a prompt there.

It's already transcribed, and now it's building the plan. So, you just wait. It also checks the ending of your take. If your clip is cut off in the middle of a sentence, it tells you before it edits anything, so you don't find out at the end after the video is already produced.

Then, in step 3, it plans the video using your saved style and your saved brand. It follows a set of editing rules I built from months of real edits. A change on screen at least every 4 seconds. You stay full frame for about 4 seconds at a time, 6 at most.

Nothing sits on your face. No captions go on your face. Text stays clear of the places where the app buttons live, and effects land on the exact word you say. Not a guess.

It asks for my approval, and I will confirm. Next, I will ask it to show me the storyboard as well. With your first run, it should show you the storyboard of what your video will look like, whether it's an animated explainer, a talking head video, a yap, or a faceless video with just B-roll and a voiceover. Whatever it is, it will show you a storyboard, while it renders the clips to show you previews.

So, you'll start to see your video clip and a preview of the captions. You can zoom in and zoom out on it, and you're going to see quite a few of these. It's also going to show you previews of effects that it chose for you. It says, "The storyboard looks solid overall, but I found two caption issues."

So it's doing its job, and in the process, it lets you know what it finds, what it doesn't like, and what it will change. Here's another storyboard where it changed workplace from the styling issue it was having before. And now, it says, "Here's your storyboard. I will add my folder."

For a yap, you really don't want too many effects in the video, but it depends on the type of yap video you're recording. You might want a lot hype in actions, and if you do, just tell your assistant in plain English. As for this example, I'm actually going to ask for more effects. Since this is a

vlogmas video, where I'm starting a series for the 25 days of vlogmas, and this is day one, I really want it to have some cool effects.

So what would be the best effects that wouldn't take away from the video? I'm going to ask for its suggestions and recommendations about effects. Remember, we have over 100 effects, so asking it to add some is absolutely fine. It's reading the effects catalogue and will tell me all the effects it thinks would work.

Now, it responds with a few effects to tie in. Since my clip already has a lot going on the Christmas tree, the sign, the red hair the assistant recommends, that I don't want to take away from that. So it suggests a warm holiday look for the whole video, a light golden hour grade, soft glow, and a little dust. I actually don't think I want the warm holiday look, but I do want the timestamp.

I think the 25 day countdown ring sounds pretty cool, and a pencil strike on an old spreadsheet, and a day two stamp on tomorrow. Those sound pretty cool. Okay, so it says what I would skip. Effects that go behind you.

Letterbox and cinema bars. Hyper effects. No problem. If you want a bolder open, you have the gravity drop of day one.

I like that. So for this video, instead of doing the recommended five or any of those, I'm going to have a little chat with it. I really like your ideas. I don't want the warm holiday look for the whole video, because I like the way my video looks now.

I will say yes to the vlogmas stamp, yes to the 25 day countdown ring, the pencil strike, the day two stamp on tomorrow, and I also think the gravity drop would be pretty interesting to see. I like the idea of the stamp, but the gravity drop might be pretty cool, so I don't know. Could I see both? As you can see, it says I'm building two versions.

Both have the countdown ring. It's telling you exactly what it's going to build, and you will see it in your storyboard. So that's the exciting thing. storyboard.

If there are any other changes you want to make, just as you saw me do, ask for them in plain words. You can say, make the captions bigger, move the captions to the top, try the spotlight style. It never overwrites your old video. It just makes a new version and keeps the first one.

Isn't that cool? If you have several clips, you can ask for a batch. It makes them one after the other. I have done this.

I've taken a whole folder from Google Drive with 20 video clips. I gave it the Google Drive link and said, edit my animated explainer videos. And they all started finishing up, one by one. It was extremely exciting.

So you're seeing this in real time now. It's starting to give a few effects, so you can see what it looks like. Now, the issue I'm seeing, though it might not keep it that way, especially here, is that the captions are over flooding the effect. You can tell it to take a look at that particular issue by providing a screenshot of what you see and move the captions.

But again, this is just a shot taken from the updated storyboard and not your final video clip. Before the final video renders, you will see what the actual animations look like in the draft version of the video. Oh, and one more thing. It doesn't post for you or schedule anything for you.

The finished video is yours to post, unless you have Claude or ChatGPT connected to one of your posting apps. I do have a posting app that I use. Once I finish with the video, I tell it to run the MCP for that particular software, and it will post and schedule my videos directly with captions and everything. But that's because I've programmed my MCP to be set up that way.

If you don't have that, no worries. You can just download your video and share it yourself. See, what I was talking about before is now fixed. I was saying how the captions were overlapping, but now you don't see it.

This is pretty cool. All right. We're down to where it's finalizing the stamp and doing a couple of other things. So, I'm just going to tell it to render both videos, and once it finishes rendering, you're all done, and you've just made your first video.

Next up is lesson 5, where we make it look even more like you. I'll see you there. Oh, and if you want to see what the final version of this video looks like, you can check below this video in this lesson.
